User Guide to Cricket Database Systems Assignment

Step by step implementation guide:

Open your Linux terminal. Then locate into the file containing all of the command files etc. (Or you can move those files into the current directory you are in).

1) To locate into the required directory, type in the terminal:

```
"cd IsaacNathan_21564668_DbS2025T3"
```

2) Then, type this command in the terminal:

```
"mysql -u me -p"
```

3) The terminal will prompt you to type a password. The password is:

```
"myUserPassword"
```

4) Once you have entered the mysql server, you are going to have to enter:

```
"SOURCE create_tables.sql"
```

This creates all the required tables.

5) Then the next command to enter will be:

```
"SOURCE insert_data.sql"
```

This command inserts all the sample data into the tables, populating them.

- 6) Now that you have all the required data relating to the tables, to run the queries and see the outputs in the terminal, type:

`"SOURCE queries.sql"`

Python to Database

To run the python file:

- 1) Firstly, make sure that all the required packages are installed:

If not type this in the terminal:

`pip install mysql-connector-python`

- 2) Then in the terminal (not in the mysql server), type:

`"python3 pythonToDatabase.py"`

Advanced Features

- 1) To run the advanced features, you must connect to mysql (as explained previously), then type

`"SOURCE advanced_features.sql"`

All the advanced features I implemented will be run and the outputs will be displayed.

(In the case you ever run into a situation that says that there is no database selected, type `"USE dswork;"` and then run the sql code again.)
